SYSTEM, METHOD AND ARTICLE OF MANUFACTURE FOR A
COMMON CROSS PLATFORM FRAMEWORK FOR DEVELOPMENT OF
DVD-VIDEO CONTENT INTEGRATED WITH ROM CONTENT

Express Mail Mailing Label No. ET419347901US

1002020 "6/24/86860

5 **SYSTEM, METHOD AND ARTICLE OF MANUFACTURE FOR A
COMMON CROSS PLATFORM FRAMEWORK FOR DEVELOPMENT OF
DVD-VIDEO CONTENT INTEGRATED WITH ROM CONTENT**

10 This patent document claims priority to Provisional
Patent Application No. 60/216,822 under 35 U.S.C. § 119(e).

15 **BACKGROUND OF THE INVENTION**

20 The present invention relates to enhancement of
multimedia content and more particularly to a system, method
and apparatus for enhancing multimedia content with
25 supplemental content.

20 Multimedia computer systems have become increasingly
popular over the last several years due to their versatility
and their interactive presentation style. A multimedia
computer system can be defined as a computer system having a
25 combination of video and audio outputs for presentation of
audio-visual displays. A modern multimedia computer system
typically includes one or more storage devices such as an
optical drive, a CD-ROM, DVD (DVD-Video or DVD Audio etc),
30 Laser Disc, Video Disc or Audio Disc, or a hard drive. Audio
and video data are typically stored on one or more of these
mass storage devices. In some file formats the audio and
video are interleaved together in a single file, while in
other formats the audio and video data are stored in different
35 files, many times on different storage media. Audio and video
data for a multimedia display may also be stored in separate
computer systems that are networked together. In this
instance, the computer system presenting the multimedia
display would receive a portion of the necessary data from the
35 other computer system via the network cabling.

Multimedia computer systems have become increasingly popular over the last several years due to their versatility and their interactive presentation style. A multimedia computer system can be defined as a computer system having a combination of video and audio outputs for presentation of audio-visual displays. A modern multimedia computer system typically includes one or more storage devices such as an optical drive, a CD-ROM, a hard drive, a videodisc, or an audio disc, and audio and video data are typically stored on one or more of these mass storage devices. In some file formats the audio and video are interleaved together in a single file, while in other formats the audio and video data are stored in different files, many times on different storage media. Audio and video data for a multimedia display may also be stored in separate computer systems that are networked together. In this instance, the computer system presenting the multimedia display would receive a portion of the necessary data from the other computer system via the network cabling.

Graphic images used in Windows multimedia applications can be created in either of two ways, these being bit-mapped images and vector-based images. Bit-mapped images comprise a plurality of picture elements (pixels) and are created by assigning a color to each pixel inside the image boundary. Most bit-mapped color images require one byte per pixel for storage, so large bit-mapped images create correspondingly large files. For example, a full-screen, 256-color image in 640-by-480-pixel VGA mode requires 307,200 bytes of storage, if the data is not compressed. Vector-based images are created by defining the end points (corners), thickness, color, pattern and curvature of lines and solid objects within an image. Thus, a vector-based image includes a definition that consists of a numerical representation of

TO20/CD-5/4186860

the coordinates of the object, referenced to a corner of the image.

Bit-mapped images are the most prevalent type of image storage format, and the most common bit-mapped-image file formats are as follows. A file format referred to as BMP is used for Windows bit-map files in 1-, 2-, 4-, 8-, and 24-bit color depths. BMP files contain a bit-map header that defines the size of the image, the number of color planes, the type of compression used (if any), and the palette used. The Windows DIB (device-independent bit-map) format is a variant of the BMP format that includes a color table defining the RGB (red green blue) values of the colors used. Other types of bit-map formats include the TIF (tagged image format file), the PCX (Zsoft Personal Computer Paintbrush Bitmap) file format, the GIF (graphics interchange file) format, and the TGA (Texas Instruments Graphic Architecture) file format.

The standard Windows format for bit-mapped images is a 256-color device-independent bit map (DIB) with a BMP (the Windows bit-mapped file format) or sometimes a DIB extension.

The standard Windows format for vector-based images is referred to as WMF (Windows meta file).

Full-motion video implies that video images shown on the computer's screen simulate those of a television set with identical (30 frames-per-second) frame rates, and that these images are accompanied by high-quality stereo sound. A large amount of storage is required for high-resolution color images, not to mention a full-motion video sequence. For example, a single frame of NTSC video at 640-by-400-pixel resolution with 16-bit color requires 512K of data per frame. At 30 frames per second, over 15 Megabytes of data storage are required for each second of full motion video. Due to the

TO2020D 5/4/86 860

large amount of storage required for full motion video, various types of video compression algorithms are used to reduce the amount of necessary storage. Video compression can be performed either in real-time, i.e., on the fly during

5 video capture, or on the stored video file after the video data has been captured and stored on the media. In addition, different video compression methods exist for still graphic images and for full-motion video.

10 Examples of video data compression for still graphic images are RLE (run-length encoding) and JPEG (Joint

Photographic Experts Group) compression. RLE is the standard compression method for Windows BMP and DIB files. The RLE compression method operates by testing for duplicated pixels

15 in a single line of the bit map and stores the number of consecutive duplicate pixels rather than the data for the pixel itself. JPEG compression is a group of related

standards that provide either lossless (no image quality degradation) or lossy (imperceptible to severe degradation)

20 compression types. Although JPEG compression was designed for the compression of still images rather than video, several manufacturers supply JPEG compression adapter cards for motion video applications.

25 In contrast to compression algorithms for still images, most video compression algorithms are designed to compress full motion video. Video compression algorithms for motion video generally use a concept referred to as interframe compression, which involves storing only the differences

30 between successive frames in the data file. Interframe compression begins by digitizing the entire image of a key frame. Successive frames are compared with the key frame, and only the differences between the digitized data from the key frame and from the successive frames are stored.

T020400-62436860

Periodically, such as when new scenes are displayed, new key frames are digitized and stored, and subsequent comparisons begin from this new reference point. It is noted that interframe compression ratios are content-dependent, i.e., if 5 the video clip being compressed includes many abrupt scene transitions from one image to another, the compression is less efficient. Examples of video compression which use an interframe compression technique are MPEG, DVI and Indeo, among others.

10

MPEG (Moving Pictures Experts Group) compression is a set of methods for compression and decompression of full motion video images that uses the interframe compression technique described above. The MPEG standard requires that 15 sound be recorded simultaneously with the video data, and the video and audio data are interleaved in a single file to attempt to maintain the video and audio synchronized during playback. The audio data is typically compressed as well, and the MPEG standard specifies an audio compression method referred to as ADPCM (Adaptive Differential Pulse Code 20 Modulation) for audio data.

TO20/0-54186860

A standard referred to as Digital Video Interactive (DVI) format developed by Intel Corporation is a compression 25 and storage format for full-motion video and high-fidelity audio data. The DVI standard uses interframe compression techniques similar to that of the MPEG standard and uses ADPCM compression for audio data. The compression method used in DVI is referred to as RTV 2.0 (real time video), and this 30 compression method is incorporated into Intel's AVK (audio/video kernel) software for its DVI product line. IBM has adopted DVI as the standard for displaying video for its Ultimeda product line. The DVI file format is based on the Intel i750 chipset and is supported through the Media Control

Interface (MCI) for Windows. Microsoft and Intel jointly announced the creation of the DV MCI (digital video media control interface) command set for Windows 3.1 in 1992.

5 The Microsoft Audio Video Interleaved (AVI) format is a special compressed file structure format designed to enable video images and synchronized sound stored on CD-ROMs to be played on PCs with standard VGA displays and audio adapter cards. The AVI compression method uses an interframe 10 method, i.e., the differences between successive frames are stored in a manner similar to the compression methods used in DVI and MPEG. The AVI format uses symmetrical software compression-decompression techniques, i.e., both compression and decompression are performed in real time. Thus AVI files 15 can be created by recording video images and sound in AVI format from a VCR or television broadcast in real time, if enough free hard disk space is available.

20 As discussed above, such audio and video content is often stored on media such as CD-ROM or digital video disc (DVD). However, once a vendor has delivered such content to a customer, the vendor loses any practical control over the product. Even if the product is delivered under license 25 rather than out right sale, it has traditionally been difficult to prevent a customer from copying the content or providing the content to any number of friends so that they might illegally copy the content.

30 The now familiar compact disk preserves information as a series of microscopic pits and smooth areas, oriented in concentric circular or helical tracks, on the otherwise smooth, planar surface of an annular disk. Recorded information is read from a compact disk by directing a focused

TB2040-6/486860

laser beam along the recorded tracks, and detecting variations in the intensity of the laser beam along the recorded tracks, and detecting variations in the intensity of the laser beam as it encounters the microscopic pits and smooth areas on the 5 disk. The coherence and relatively short wavelength of laser radiation enables large volumes of information to be written onto very small spaces of a recording medium.

Compact disks were first introduced in the music 10 recording industry in 1982, and now account for 43% of all recorded music sales. In the United States alone, over three hundred million compact disks are sold annually, with a retail value of over three billion dollars, according to the 15 Recording Industry Association of America. The most prevalent format for recording multimedia events onto such disks is Digital Video or Versatile Disk (DVD). The DVD is a read only format for recording a relatively large amount of high quality data. When delivered to a user, the disk is input into a CD-ROM player on a client device such as a computer. Software on 20 the client device allows the DVD formatted data to be read.

Once the DVD disk has been manufactured the content 25 is essentially fixed. The content that the user can access from the disk is limited to the content provided when the disk was manufactured. In order to update the information, a new disk must be created and delivered to the user. This is an expensive and inconvenient solution.

Thus there remains a need for a system for easily 30 and efficiently updating content provided on a DVD-disk. Such a system would preferably allow update information to be delivered via a network such as the Internet. In addition, such a system would take advantage of software capabilities already present on the client device, and would importantly be

able to function on the many different possible platforms of client devices, such as for example Macintosh, PC or a set top box.

5 Disc technologies that are re-writeable like a CD-RW or technologies that allow multiple sessions can be used for adding additional or updated content directly to the disc. Thus for multi-session discs, where the first session of the disc is write-once and additional sessions on the disc can be 10 either write-one, or rewriteable, additional or updated content can be added to these additional sessions of the disc. This includes such technologies as the "Orange Book" specification for CD-ROM, including CD-PROM and Multimedia discs such a Dataplay.

15 Flash memory based and other similar memory technologies can be used for storing multimedia and additional or updated content as well. This includes IBM technology that uses a USB interface to coupled a personal computer to a 20 storage device such as a "keychain" memory device.

The present invention advantageously addresses the above and other needs.

25 **SUMMARY OF THE INVENTION**

The present invention advantageously addresses the needs above as well as other needs by providing the enhancement of multimedia content and more particularly to providing a system, method and apparatus for enhancing multimedia content with 30 supplemental content.

In one embodiment, the invention can be characterized as a method for providing enhanced content for play across multiple play platforms. The method employs steps 35 of delivering media content to a client device; delivering

TO2000-5749686D

HTML content to a client device, the HTML content being accessible and usable by a plurality of client device platforms; activating a browser to access the HTML content, the browser being located on and compatible for use with the 5 client device; activating firmware on the client device to access the media content; and incorporating the accessed HTML content with the accessed media content.

In another embodiment, the invention can be 10 characterized as a method for enhancing multimedia content. The method employs steps of providing a recording medium; recording content onto the recording medium; integrating HTML content with the recorded content; accessing the recorded content and the HTML content; and playing a multimedia event 15 based on the accessed content.

BRIEF DESCRIPTION OF THE DRAWINGS

The above and other aspects, features and advantages of the present invention will be more apparent from the 20 following more particular description thereof, presented in conjunction with the following drawings wherein:

Fig. 1 is a schematic diagram of a hardware implementation of one embodiment of the present invention;

Fig. 2 is a schematic diagram of a system for 25 enhancing a DVD multimedia experience;

Fig. 2A is a flow chart illustrating steps traversed upon insertion of a DVD disk (or other media) into a device, such as a DVD player;

Fig. 3 is a flowchart illustrating logic for 30 incorporating update information to supplement a DVD multimedia play experience;

Fig. 4 is graphical representation of data layouts for bitmap layers;

Fig. 5 is a flowchart illustrating a method for 35 providing an enhanced multimedia experience; and

102020.5/486860

Fig. 6 is a flowchart illustrating a method for enhancing DVD content with ROM content.

Corresponding reference characters indicate corresponding components throughout the several views of the drawings.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

The following description of the presently contemplated best mode of practicing the invention is not to be taken in a limiting sense, but is made merely for the purpose of describing the general principles of the invention.

The scope of the invention should be determined with reference to the claims.

Fig. 1 illustrates a system for providing enhanced DVD content for play across multiple user platforms. Both DVD-Video content and HTML content are recorded on DVD discs and provided to a user. The HTML content includes various directories that allow it to be accessed by multiple platforms of user devices. Once inserted into a user device, browser software on the user device accesses the HTML content and supplies supplemental update information to enhance the play experience provided by the DVD-Video content. The supplemental update information can be either retrieved via a network such as the Internet or can be provided directly from the HTML data itself stored on the DVD disc.

In various embodiments, the client devices may take the form of computers, televisions, stereos, home appliances, or any other types of devices. In one embodiment, the client apparatuses and the host computer each include a computer such as an IBM compatible computer, Apple Macintosh computer or UNIX based workstation.

A representative hardware environment is depicted in

Fig. 1, which illustrates a typical hardware configuration of a workstation in accordance with a preferred embodiment having a central processing unit 110, such as a microprocessor, and a number of other units interconnected via a system bus 112.

5 The workstation shown in Fig. 1 includes a Random Access Memory (RAM) 114, Read Only Memory (ROM) 116, an I/O adapter 118 for connecting peripheral devices such as disk storage units 120 (i.e. DVD playback device) to the bus 112, a user interface adapter 122 for connecting a keyboard 124, a mouse 10 126, a speaker 128, a microphone 132, and/or other user interface devices such as a touch screen (not shown) to the bus 112, communication adapter 134 for connecting the workstation to a communication network (e.g., a data processing network) and a display adapter 136 for connecting 15 the bus 112 to a display device 138. The workstation typically has resident thereon an operating system such as the Microsoft Windows NT/2000 or Windows 95/98/ME Operating System (OS), the IBM OS/2 operating system, the MAC OS, or UNIX operating system. Those skilled in the art will appreciate 20 that the present invention may also be implemented on platforms and operating systems other than those mentioned.

A preferred embodiment is written using JAVA, C, HTML and the C++ language and utilizes object oriented 25 programming methodology. Object oriented programming (OOP) has become increasingly used to develop complex applications. As OOP moves toward the mainstream of software design and development, various software solutions require adaptation to make use of the benefits of OOP. A need exists for these 30 principles of OOP to be applied to a messaging interface of an electronic messaging system such that a set of OOP classes and objects for the messaging interface can be provided.

A preferred embodiment of the invention utilizes

102070-67436860

Hypertext Markup Language (HTML) to implement documents on the Internet together with a general-purpose secure communication protocol for a transport medium between the client and the Newco. HTTP or other protocols could be readily substituted for HTML without undue experimentation. Information on these products is available in T. Berners-Lee, D. Connolly, "RFC 1866: Hypertext Markup Language - 2.0" (Nov. 1995); and R. Fielding, H. Frystyk, T. Berners-Lee, J. Gettys and J.C. Mogul, "Hypertext Transfer Protocol -- HTTP/1.1: HTTP Working Group Internet Draft" (May 2, 1996). HTML is a simple data format used to create hypertext documents that are portable from one platform to another. HTML documents are SGML documents with generic semantics that are appropriate for representing information from a wide range of domains. HTML has been in use by the World-Wide Web global information initiative since 1990. HTML is an application of ISO Standard 8879; 1986 Information Processing Text and Office Systems; Standard Generalized Markup Language (SGML).

To date, Web development tools have been limited in their ability to create dynamic Web applications which span from client to server and interoperate with existing computing resources. Until recently, HTML has been the dominant technology used in development of Web-based solutions.

However, HTML has proven to be inadequate in the following areas:

- Poor performance;
- Restricted user interface capabilities;
- Can only produce static Web pages;
- Lack of interoperability with existing applications and data; and
- Inability to scale.

TOP20/0-6/24383600

Sun Microsystem's Java language solves many of the client-side problems by:

- Improving performance on the client side;
- Enabling the creation of dynamic, real-time Web applications; and
- Providing the ability to create a wide variety of user interface components.

With Java, developers can create robust User

10 Interface (UI) components. Custom "widgets" (e.g., real-time stock tickers, animated icons, etc.) can be created, and client-side performance is improved. Unlike HTML, Java supports the notion of client-side validation, offloading appropriate processing onto the client for improved performance. Dynamic, real-time Web pages can be created. Using the above-mentioned custom UI components, dynamic Web pages can also be created.

Sun's Java language has emerged as an industry-

20 recognized language for "programming the Internet." Sun defines Java as: "a simple, object-oriented, distributed, interpreted, robust, secure, architecture-neutral, portable, high-performance, multithreaded, dynamic, buzzword-compliant, general-purpose programming language. Java supports
25 programming for the Internet in the form of platform-independent Java applets." Java applets are small, specialized applications that comply with Sun's Java Application Programming Interface (API) allowing developers to add "interactive content" to Web documents (e.g., simple
30 animations, page adornments, basic games, etc.). Applets execute within a Java-compatible browser (e.g., Netscape Navigator) by copying code from the server to client. From a language standpoint, Java's core feature set is based on C++. Sun's Java literature states that Java is basically, "C++

with extensions from Objective C for more dynamic method resolution."

Another technology that provides similar function to JAVA is provided by Microsoft and ActiveX Technologies, to give developers and Web designers wherewithal to build dynamic content for the Internet and personal computers. ActiveX includes tools for developing animation, 3-D virtual reality, video and other multimedia content. The tools use Internet standards, work on multiple platforms, and are being supported by over 100 companies. The group's building blocks are called ActiveX Controls, small, fast components that enable developers to embed parts of software in hypertext markup language (HTML) pages. ActiveX Controls work with a variety of programming languages including Microsoft Visual C++, Borland Delphi, Microsoft Visual Basic programming system and, in the future, Microsoft's development tool for Java, code named "Jakarta." ActiveX Technologies also includes ActiveX Server Framework, allowing developers to create server applications. One of ordinary skill in the art readily recognizes that ActiveX could be substituted for JAVA without undue experimentation to practice the invention.

In accordance with one embodiment, a cross-platform DVD specification defined, which is called InterActual Technologies Cross Platform, hereafter referred to by the name ITX. By following the ITX specification, DVD authors can create HTML-enhanced DVD-Video/Audio content that can play reliably across multiple playback platforms, ranging from computers (such as Windows and Macintosh) to Internet-connected set-top devices (such as the Sony Playstation II and Nuon-enhanced consumer DVD players). The general requirements for enhanced DVD authoring and the requirements for the

102070-67435260

playback devices, both hardware and software are described herein.

The ITX enables DVD-Video/Audio (hereafter referred to only as DVD-Video) content developers to create products that seamlessly combine the Internet and/or other DVD-ROM capabilities with DVD-Video to create a richer, more interactive, and personalized entertainment experience for their customers. All this is accomplished without the need for content developers to create special content for each unique playback platform, and without the need of becoming an expert programmer on Windows, Macintosh, and other platforms. Additionally the present invention allows for customized content and functions tailored for specific platform(s).

15

Internet connectivity is not a requirement for the use of ITX. A stand-alone system with HTML browser functionality is all that is required. In addition, CD-DA (standard music CDs) can also be enhanced by use of ITX.

20

The following terms are defined as follows:

Term	Description
BCA	Burst Cutting Area. Area near inner ring on a DVD disc where custom data can be imprinted
ATVEF	Advanced Television Enhancement Forum (spec allows combining HTML and TV programming)
PIP	Picture in Picture
DVD-Video	A disc authored in accordance with the DVD-Video specification. Any place where the term DVD-Video is used it also applies to DVD-Audio,

T020/D-6748860

	unless specifically excluded.
UOP	User Operations (as defined DVD-Video and DVD-Audio specifications)

The following documents are incorporated by reference:

1.	HTML Cross Platform Authoring Guidelines
2.	ISO-9660
3.	ATVEF Specification (http://www.atvef.com)
4.	DVD-Video (Book 3) and DVD-Audio (Book 4) specifications

5

The ITX specification provides a common framework whereby content developers, browser providers, and hardware manufacturers can successfully create and playback Internet-enhanced DVD and CD products.

This description of the embodiments is divided into three major sections, targeting three different audiences:

15 • **Content Development Requirements:** Addresses issues specific to DVD authors and content creators. The target audience includes DVD authoring facilities, web designers, and graphics and creative production facilities. This section outlines the integration of DVD-Video with Web Pages, 20 Programming Interfacing, and other cross-platform DVD-Video and DVD-ROM authoring considerations.

20 • **Browser Requirements:** Addresses issues specific to browser implementation. The target audience includes establishments

T020120080860

such as: PlanetWeb, Spyglass, Liberate, and VM Labs (with a custom implementation of the Spyglass browser). This section outlines basic browser requirements to support ITX titles and integration of a DVD-Video programming interface.

5

- **Platform/Hardware Requirements:** Addresses issues specific to DVD-Video hardware platforms. The target audience includes specialized chip manufacturers, consumer DVD-Video player, game system manufacturers (Sony Playstation, Nintendo, Sega), and any others who might incorporate web connectivity into DVD player products. This section outlines display requirements, browser interfaces, and other hardware-specific requirements.

15

With reference to Fig. 2, in an embodiment, a system 200 is provided for enhancing an internet play experience. ROM/HTIM content 202 is recorded onto a DVD disc 204. Additionally DVD-Video content 206 is also recorded onto the DVD disc. The disc 104 is inserted into a client device 208 that contains Browser/Presentation software 210 thereon. The client device hardware also includes a DVD Firmware/Navigator 212 that reads the DVD-Video content. In addition, the client device 208 includes a Browser/Presentation Engine software 110, which reads the ROM/HTML Content. The Browser/Presentation Engine can be for example Netscape Navigator or some other engine commonly available on personal computers. After reading the ROM/HTML content, the browser software 110 searches the Internet to find supplemental information related to the DVD content and incorporates the supplemental information into the DVD content 202, 206 to create an Internet Enhanced DVD Experience 214.

To better understand the purpose and goals of ITX three possible usage scenarios are described, each with an

increasing level of complexity.

DVD-Video disc with movie script provided:

5 A movie is authored with the entire screenplay provided on the DVD disc in HTML format. Clicking on any scene visually represented in the HTML immediately links the user to that scene within the DVD-Video. Besides being a finer granularity than the normal chapter navigation provided on
10 DVD-Video, the HTML-based script could contain other media (pictures, audio) and/or live web links for other information (stored either on the DVD disk, or accessible through the Internet). Further, the text of the screenplay in HTML could automatically "scroll" with the DVD-Video to give the
15 appearance of being synchronized with the DVD-Video. Although many of these types of features (minus live web links and synchronized scrolling) could be authored in DVD-Video, HTML authoring is much more efficient, immediate and widely known.

20 More complex menus:

A DVD-Video is shipped with a simple HTML page that does little except start a movie. However, the HTML page also uses the Internet and checks to see if that movie has any web
25 site updates. If it does, then the HTML page launches a new movie menu that is downloaded from the web. This new menu might have e-commerce opportunities (buy gifts based on the movie; buy tickets for the sequel to the DVD, etc.). Because the new movie menu is not on the DVD-Video, but rather is on a
30 server accessible via the internet, the window of time during which the choices on the new movie menu is available can be decided by the studio long after the DVD-Video has shipped. The new movie menu may have new links to an actor's web site, which can be particularly advantageous if, for example, the

40202010-574868660

actor has become a star since the movie was made, and therefore wasn't given star treatment in the original DVD-Video. The new movie menu may just be a more convenient way to navigate the disc to a finer granularity than the chapters 5 provided. Advantageously, in accordance with the present embodiment, the DVD can have new movie menus stored on a server accessible through the internet, and that can be changed over time. If the DVD-Video is played without ITX, the DVD-Video operates in a conventional manner.

10

Live webcast with the director or stars in live chat:

A DVD-Video movie is shipped with an HTML page that 15 links the user to an ITX web site. This site (and studio advertising) notifies the user of the date/time of a "live chat" with, for example, the movie's director, who will discuss the making of the movie. Near the event starting time, the user connects to the web site with the DVD-Video in 20 his/her DVD player. At the start time, the director begins sending voice (such as streaming audio, e.g., Real Audio) over the Internet. The director controls the DVD player of the user, as well as other DVD players, by sending play, pause, fast-forward, and rewind commands, etc. (Latecomers are 25 automatically synchronized). User (if they have, for example, a browser with a keyboard) can enter questions. The director can choose which questions to answer and control every DVD player to an appropriate scene in the movie and discuss the scene. Through the use of bitmap overlay layers and drawing 30 tools, the director can pause the video and draw on the screen (like a football play) to better explain the details involved in creating a certain scene, for example. As the director moves from one question to another the video can use transitions and special effects to make the presentation more

T020700-67486860

professional and entertaining.

In order to support the above-described functionality, the present embodiment is as follows. An ITX 5 disk can contain DVD Video and ITX-compatible ROM data, DVD-Audio and ITX-compatible ROM data, CD-Audio and ITX-compatible ROM data, or the like. The ITX compatible ROM data can be any digital file type including HTML and graphics, including for example, HTML graphics, subject to file system limitations 10 described below. There is no theoretical limit to the amount of ITX compatible ROM data that can be placed on a DVD disk, except for physical constraints of the DVD disk (or in an alternative embodiment CD-disk).

An ITX-compatible disk adheres to rules regarding 15 capability, detection, file system, directory structure, and content location, each of which is described in further detail herein. As multi-platform support is a goal of the present embodiment, an ITX disk provides for both platform-specific behavior and general-purpose behavior. Platform-specific 20 behavior can be accomplished using the ITX-API described above, by either placing platform-specific binaries on the DVD disk in predefined directories, described herein, or by authoring general purpose HTML content that uses, for example, ECMAScript or JavaScript and the ITX API to detect specific 25 platforms and to "serve" web pages specifically designed for a particular platform, i.e., particular type of device. General purpose content can be created for playback on multiple platforms using HTML content and the ITX API. Both approaches can be combined so that platform-specific behavior can be 30 employed with certain devices, while other devices, such as devices developed after release of the DVD disk, can be supported with general-purpose behavior.

For personal computers, such as personal computers

TD20/0-62486850

operating under Microsoft Windows, ITX content can be viewed through a proprietary browser client per the ITX content viewed through the proprietary browser client can be the same content that is displayed on, for example, a browser-enhanced 5 consumer electronics system, such as a set top box, a game console, or an internet-connected DVD player or the like.

The device must provide a capability to determine the type of media that has been inserted into the device. 10 Specifically, the device must be able to determine whether the media is a DVD disk or some form of CD disk. For CD-DA, there may or may not be a file structure formatted on the CD-DA disk 15 table of contents must be read per the "red-book" specification.

An ITX-compatible DVD or CD is detected by checking for the existence of a file named index.htm in a directory named common. The ITX-API version information can be found in 20 a mediated area in the index.htm file, which is an HTML file.

The index.htm file provides JavaScript that detects the particular type of device into which the DVD disk has been 25 inserted, and the device is "navigator," and provides general framework for interactive playback. For a disk not authored in accordance with the ITX content, a content homepage is employed, i.e., file named default.htm is employed. The default.htm file may be stored in memory on the device.

30

CONTENT DEVELOPMENT REQUIREMENTS:

This section describes the requirements for content developers, DVD authors, and creative houses. This section outlines how DVD-Video can be integrated with ROM content for playback across multiple hardware platforms and multiple

5 browsers. For more information regarding cross-platform HTML development (independent of integration with DVD-Video), refer to the InterActual™ HTML Cross Platform Authoring Guidelines document. This reference document outlines platform/browser detection, use of JavaScript files (.js files) and other HTML 10 authoring techniques.

DVD/ROM Authoring Considerations:

ITX Directory and File Naming Conventions (mandatory

15 compliance)

When making an ITX disk, DVD video zone files must be placed physically at the beginning of the ITX disk, contiguously, in the order specified by the DVD-Video 20 specification, likewise, DVD-Audio zone files must follow the DVD-Video files in contiguous order.

The DVD specifications for DVD-Video and DVD-Audio require that each disc contain specific directories and files.

25 For example, the DVD-Video files are contained in a directory (or folder) with the name VIDEO_TS; DVD-Audio files in the AUDIO_TS directory. The VIDEO_TS and AUDIO_TS directories should be the first entries in the directory descriptor (the true order of the directory and file entries is usually 30 hidden, since most operating systems list them in, for example, alphabetical order). There is no such requirement for "DVD-ROM" content, and, thus, developers can arrange other files on a disc in any desired manner. It is best to place ROM-zone files in subdirectories versus the root directory.

102040-6/486860

The placement of files on a dual-layered disk (DVD-9, DVD-14, or DVD-18) is generally independent of layer details. DVD-Video and DVD-Audio files must begin on layer zero. ROM-zone files are beginning after the DVD-Video (or DVD-Audio) files 5 and can cross layer boundaries, if needed. In order to prevent problems that can arise from this open aspect of the specifications, ITX provides a convention for ordering and naming files.

10 Files stored for use with ITX can be in any DVD disc directory. However, there must be a method that allows the platform-specific browser and/or playback engine to identify the initial starting HTML file in the case where there is no executable file. Also, in order to simplify support, it is 15 strongly suggested that the full convention described below be followed on all ITX-authored discs.

ITX Naming Standard:

20 Each DVD-Video authoring system and tool set supports different naming capabilities; such as ISO-9660, ISO-9660 with Joliet extensions, Macintosh file names, support for Macintosh resources, hybrid discs, etc. Some authoring tools go even further by forcing a certain character case (e.g., the 25 Toshiba authoring system forces all characters to uppercase). These issues must be taken into account as part of the development process since some playback platforms may operate differently depending on the physical layout and file structure on the DVD. As a specific example, Windows and 30 Macintosh operating systems are case *insensitive*, whereas Unix and Linux operating systems are case *sensitive*.

For ITX compliance, the following naming standard must be followed:

- UDF 1.02 and ECMA 167 (second edition)
- support for hybrid Windows/Macintosh discs (whereby resource forks for the Macintosh operating system are preserved)

5 All files and directories must be developed with case sensitivity in mind. The recommended approach is to use only capital letters for all directories, file names, and HTML references. To be safe, only use A-Z, 0-9 and the underscore.

10 The initial HTML file shall have a name of ITX.HTM.

ITX Directories:

15 The ITX.HTM file must be located in a directory that follows these rules. Other files, based on individual authoring needs may be located in any directory following any convention. There may be more than one ITX.HTM file. For example, there could be a different one for each platform supported, or just one primary one and one alternate for a single platform that requires special operations.

Directory name	Platform
COMMON	All (default)
LINUX	linux operating system
MAC	Macintosh
NINTENDO	Nintendo Dolphin
SONY	Playstation II and CE
NUON	VMLabs
WIN	Windows
SEGA	Sega Dreamcast

TOSHIBA	Toshiba
WIN	Windows
ZORAN	Zoran
To be determined	all other ITX directory names must be registered to insure no conflicts.

Directory Naming Conventions

Note that any new platform directory names should be reserved and assigned before use. However, each platform developer can control the directory structure under its reserved top-level directory name. For example, Sony could create a PS2 and PS3 directory under the SONY directory.

This directory structure allows for proprietary executable binary files for each platform. For example, a current PCFriendly DVD (i.e., a DVD in accordance with the present embodiment) can utilize the directory structure by placing the Windows version of software in a WIN directory, and a Macintosh version of software in a MAC directory. Upon insertion of the disc, the platform will initiate execution of the appropriate binaries (based on some platform-specific autorun feature) and then the binaries will load the ITX.HTM file.

The set-top player browser shall locate its starting file via the following logic:

- Check for online updates enabled and online
- If OK, then check web for update and use, if found
- 25 • Else check for its platform-specific directory.
- If the platform-specific directory exists and the ITX.HTM

file is found, then start;

- Else if the COMMON ROM directory exists and the ITX.HTM file is found, then start;
- Else the disc is not an ITX disc and it should be played as a DVD-Video disc.

5 The above-described structure allows for device specific executable binary file for each type of device supported by a particular DVD disk. The platform-specific 10 directory structure and its associated set of binaries enable any platform to run executables specifically designed for any device provided that such executables are available on the particular DVD disk being utilized. This capability, in 15 essence, allows the device specific binaries to override general purpose ITX content or override a standard browser mechanism. While the actual ROM content may reside in a device specific directory, it is recommended that all content reside in the common directory when possible. The common 20 directory can support any number of subdirectories, including device specific subdirectories.

25 The common directory stores, in most cases, the actual ITX content (versus platform specific binaries). It is recommended that all ITX content (even platform specific ITX content reside in the common directory as this provides an intuitive content development approach. By maintaining a single content directory, Java Script can easily be used to detect platforms and render appropriate HTML players pages tailored to specific devices.

30 There may be cases where device specific binaries may be included on the DVD disk, but still the general-purpose content. For example, an ITX disk can utilize the directory structure by placing a Windows version of software in the WIN

directory, and the Macintosh version of the software in the MAC directory. Upon insertion of the ITX disk, the platform will initiate execution of the appropriate binaries (based on a device specific feature, such as autorun) and then the 5 binaries will load the index.htm file located in the common directory, the starting point for any general-purpose ITX disk.

10 The starting or entry point is the index.htm file, with which resides in the top level of the common directory. It is recommended that all ITX content (with the exception of device-specific binaries) be stored in the common directory. 15 Java Script can then be used to detect platforms and render appropriate HTML pages tailored to specific platforms. The index.htm file will be the background "container" web page while standard playback occurs. This page enables Java Script event handlers to be loaded and activate to handle events during playback. The meta-data of the index.htm file contains the ITX-API version information.

20 Referring to Fig. 2A, a flow chart is shown of steps traversed upon the coupling of a storage medium with, e.g., insertion of a DVD disk into, a device, e.g., a personal computer, a consumer electronics device, a game console, or 25 the like. Steps traversed upon insertion of the DVD disk into the device are divided into phases as follows. During the first phase, a disk detection algorithm determines if the disk has content in accordance with the present embodiment, i.e., whether the disk is an ITX disk, i.e., whether the disk 30 contains ITX content. This determination is made by examining whether a file named index.htm is located in a "common" directory on the DVD disk.

If the index.htm file exists, then the DVD disk is

102040-67486860

an ITX disk. Otherwise, the DVD disk is determined not to be an ITX disk. During a second phase, a determination is made as to whether the DVD disk is a DVD-Video or a DVD-Audio, or whether a disk of another type has been inserted, such as a 5 CD-DA. Logic for performing the second phase is included, generally, in the device, and this is not discussed in detail further herein. (Such logic is known.)

During a third phase, a determination is made as to 10 a default playback mode of the device. This is determined by reading a "player mode" from the property, e.g., InterActual.PlayerMode. If the device is configured for "play" mode, ITX content, e.g., HTML content, is bypassed, whereas if the device is configured for ITX mode, then the ITX 15 content is launched beginning with the index.htm file in the common directory. The ITX content itself can then be updated dynamically if the device is connected to the Internet, or an equivalent network. There is no Internet connection, or equivalent connection, the device renders ITX content from a 20 ROM portion of the DVD disk.

For non-ITX disks, when the device is configured for ITX mode, a default content home page (called default.htm) is displayed and an Internet connection, or equivalent, is 25 attempted to provide potential ITX content for the non-ITX disk.

During a fourth phase, platform specific file 30 detection occurs, and a determination is made as to whether there are platform specific binary files on the DVD disk for the device. This is accomplished by searching for a predefined directory, as described above, associated with the device.

During a fifth phase, a determination is made as to whether a connection to the internet or similar network, can be made. This step is performed for ITX disks in order to determine whether updated content is available from a server.

5 Additionally, for DVD disks without ITX content, a connection to an on-line database can be attempted, so that the database can be interrogated to determine whether a server containing content associated with the DVD disk is available. If such content is available, an interactive experience similar to
10 that available on ITX disk can be offered to the user of the device. When the device is in "play" mode, then ITX disk can display an icon, to signify that ITX content is available from the DVD disks ROM area. If the user selects the icon, a content home page is displayed, i.e., default.htm, so that the
15 user can switch to ITX mode.

With reference to Fig. 3, a process 300 for obtaining update information is described. The process 300 begins with a decision step 302 wherein a determination is
20 made as to whether the user is online and whether the user prefers to check for updates online. If the answer to decision step 302 is no, then in another decision step 304 a determination is made as to whether HTML update information is available. If such information is available then in an
25 operation 306, the ITX.HTM is started from the web and the update information is retrieved. If the answer to question 302 or both questions 302 and 304 are no, then in yet another decision step 308 a determination is made whether a platform directory exists, the platform directory applicable to the
30 platform of the user device. If an appropriate platform directory does exist, then in an operation 310, ITX.HTM is started in the platform directory. If an appropriate platform directory does not exist, then in a decision step 312 a determination is made as to whether a common directory exists

TO20/0-67486860

which can be used with the platform of the user device. If such a common directory does exist, then ITX.HTM is started in that directory. If such a common platform directory does not exist, then in a step 316 the DVD is played a normal video 5 without Internet enhancement.

It is recommended that each player have a user setup that allows the ITX functionality to be overridden, such as:

10 • Check for ITX and start as ITX if found (default setting)
15 • Check for ITX and give the user a menu choice of ITX or Standard
15 • Show the ITX icon on the screen for several seconds when ITX is found (include a remote control function that re-starts discs in ITX mode)
15 • Play all discs as DVD-Video, ignoring ITX

ITX Programming Interface (mandatory compliance):

20 This section describes the ITX application programming interface (API) for controlling and scripting ITX-enhanced discs. The API is divided into five sections:

25 • **Embedding.** Syntax for embedding DVD-Video within a web page. This section also addresses displaying video full screen and in a window.
30 • **Commands.** Commands control the playback and search mechanisms of a DVD-Video disc.
30 • **Properties.** Properties are used to query attributes of the DVD-Video and set certain configuration properties.
30 • **Events.** Events are used to trigger notification of various playback conditions, such as time changes, title changes and UOP changes. Events are essential for

TOP2020-6/1435860

scripting and synchronizing the video with other assets.

Embedding:

5 This section describes how to embed DVD-Video within an HTML page and control its layout.

10 Computer operating systems shall embed DVD-Video using currently available embedding techniques. Examples for each of the major computer operating systems is are provided below:

Operating System	Example
Windows	<pre><object ID="PCFriendly" CLASSID="clsid:A0739DE5-571F-11D2- A031-0060977F760C" BORDER="1" WIDTH=50% HEIGHT=60% > </object></pre>
Apple/Macintosh	<pre><embed ID="PCFriendly" TYPE="application/x-pcfriendly- plugin" ALT="PCFriendly Plug In" HIDDEN="TRUE" > </embed></pre>
Linux	TBD
Others	TBD

Examples for embedding DVD-Video in HTML

15 After the DVD-Video object is embedded in the web page, it can be accessed using any style sheet, link, or scripting language. Values for the ID string must begin with a

TOP/0.62486860

letter (A-Z or a-z) and may be followed by any number of letters, digits, hyphens, and periods up to a maximum of 48.

Unlike computers, set-top boxes do not generally 5 have a full-blown operating system and browser. Therefore, the capabilities within the browser are often more restricted. For embedding DVD-Video within these platforms using ITX, the "PCFriendly" ID must be integrated within the embedded browser as any other tag structure. With this approach, any embedded 10 browser that encounters the "PCFriendly" tag, would automatically associate this identifier with the ITX programming API described later in this section.

While many possible windows configurations are 15 possible for displaying the update data, the update data is preferably provided on a screen in the following manner:

- Toggling between full screen
- Displaying within frame
- Dynamic resizing

20

Commands:

Commands (also known as functions or methods in OOP terminology) control the playback and navigation mechanisms of 25 a DVD-Video/Audio or CD-DA disc. Commands can be used by the calling application (HTML, C++, or other) to initiate a DVD/CD playback function. The commands supported by ITX are listed below.

30

- All commands support return values as shown above.
- See notes at the end of the table and for a description of the optional time and FX parameters designated by [*].

TO2000-62486860

- Items in square brackets [] are optional.

T020700-5/486860

ITX Commands	Description	DVD Play er	CD - DA	Suppo rt Level	Range
Open(filename type)	Opens specified file name. See note 1.	Both	Y	Base	-
Play([*])	Start playback of the DVD.	Both	Y	Base	-
Pause([*])	Pause playback of the DVD (Pause_On). Subsequent issue of Pause() resumes playback (Pause_Off)	Both	Y	Base	-
Stop([*])	Stop playback of the current DVD. Stops execution of current PGC and transfers to Stop State.	Both	Y	Base	-
FastForward([x[,*]])	Fast forward the current DVD at x speed. (By default, x = 2)	Both		Base	2 - 99, although some players may allow only the DVD values of

00200479-002004

				2, 4, 8, 1 6, 32
Rewind([x[, *]])	Rewind the current DVD at x speed. (By default, x = 2)	Both	Base	same as above
Slow([x[, *]])	Play the current DVD at x speed. (By default, x = 2 for $\frac{1}{2}$ speed). Supported Features should be checked first to determine if capability is supported. See note 2.	Both	Adv	2 - 99 (recipro cal values)
SlowReverse(x[, *])	Play the current DVD at x speed in reverse. (By default, x = 2 for $\frac{1}{2}$ speed). Supported Features should be checked first to determine if capability is supported. See note 2.	Both	Adv	same as above
Step([n[, *]])	Steps playback of the DVD forward n frames. Supported Features should be checked first to determine if	Both	Adv	1 - 30

09898479 - 070201

	capability is supported. By default, n=1.				
NextChapter([*])	Halts playback of the current chapter and starts playback from the next chapter within the title.	Vide o		Base	-
PrevChapter([*])	Halts playback of the current chapter and starts playback from the start of the current chapter; or if near the start of a chapter goes to the previous chapter.	Vide o		Base	-
NextTrack()	Halts playback of the current track and starts playback from the next track in the same Audio Title within the Title Group.	Audi o	Y	Base	-
PrevTrack()	Halts playback of the current track and starts playback from the previous track in the same Audio	Audi o	Y	Base	-

,s,f[,*])	the specified. Specify time in hours, minutes, seconds, frames. (Computer must translate into milliseconds). If in TT_DOM or TT_GR_DOM and already within specified title, TimeSearch is issued to maintain all GPRM and SPRM values. Otherwise, TimePlay is issued and all GPRMs and SPRMs are initialized.			23 m: 00 - 59 s: 00 - 59 f: 00 - 29
TitleGroupPlay(g[,*])	Start playback at the specified title group number.	Audi o	Base	
TrackPlay(g, t[,*])	Start playback at the specified title group number and track number. If in TT_GR_DOM and already within specified title group, TrackSearch is issued to maintain all GPRM and SPRM values.	Audi o	Y Base	

T0207D-698472

	Otherwise, TrackPlay is issued and all GPRMs and SPRMs are initialized. In case of CD-DA, group number should be 1 by default.				
HiddenGroupPlay (g[,*])	Plays desired hidden/locked group.	Audi o		Adv	—
HiddenTrackPlay (g,t[,*])	Plays desired hidden/locked track within Hidden Group.	Audi o		Adv	—
HiddenTimePlay (h,m,s[,*])	Plays from specific time within Hidden Group.	Audi o		Adv	h: 00 – 23 m: 00 – 59 s: 00 – 59
Menu(x[,*])	Display the specified menu. See note 3.	Both		Base	1 – 5
GotoMenuItem(x ,*)	Displays menu associated with entered menu ID	Both		Adv	—
GotoBookMark (x[,*])	Continues playback at the specified bookmark location by number. See note 4.	Both	Y	Adv	—

T020/0*6/486860

SaveBookMark (x[,*])	Creates a bookmark at the current location to store with a given number. See note 4.	Both	Y	Adv	0 - n n is system dependent, about 32
Resume([*])	Resume DVD playback (if applicable based on Navigation).	Both		Base	-
Stilloff([*])	Continue with still off.	Both		Base	-
UOPMask()	Retrieve current UOPs.	Vide o		Base	-
AutoMouseHid e(b)	Show or hide the mouse cursor when the DVD is playing. (Hide occurs 2 seconds after no activity)	Both		Adv	
UpButtonSele ct([n])	Selects the up direction button n times. By default n = 1.	Both		Base	1 - 36
DownButtonSe lect([n])	Selects the down direction n times. By default n = 1.	Both		Base	1 - 36
LeftButtonSe lect([n])	Selects the left direction button n times. By default n = 1.	Both		Base	1 - 36
RightButtonS	Selects the right	Both		Base	1 - 36

TOP2000 - 5/24/2008

elect ([n])	direction button n times. By default n = 1.				
ButtonActivate()	Activate the current highlighted button.	Both	Base	-	
ButtonSelect And Activate(n)	Activate the specified highlighted button, where n is the button number between 1 and 36.	Both	Base	1 - 36	
AudioSelect(n)	Sets the stream number of the Audio to play	Both	Base	1 - 8	
SubPictureSelect(n)	Sets the stream number of the Subpicture to display	Video	Base	1 - 32	
SubPictureEnabled(n)	Enables or Disables Subpictures (subtitles)	Video	Base	0 = off 1 = on	
AngleSelect(n)	Sets the stream number of the Angle to play	Video	Base	1 - 8	
MenuLanguage Select (n)	Selects the language for the System Menu according to the language code (n). Only available in	Both	Base		

T020/n=62486860

	a Stop State.				
TextLanguageSelect(n)	Selects the language for the Audio Text Data.	Audi o	Base		
ParentalLevelSelect(n)	Selects parental level of player.	Vide o	Base	1 - 8	
ParentalCountrySelect(n)	Selects the country for the parental level.	Vide o	Base		
KaraokeSelect(x)	Changes the Audio mode for Karaoke.	Vide o	Adv	1: vocalis t 1 2: vocalis t 2 3: guide melody	
Zoom([x,y[,*,]])	Zoom (or scale) by a percentage factor of x (horizontal) and y (vertical). Individual players may support various zoom ranges, but 25% to 400% is recommended (2500 < x,y < 40000). See note 5. X and Y are integers, 100	Both	Adv	2500 - 40000 (16-bit unsigne d values)	

09898574720202

	times the percentage. By default, x and y are 10000 (100%).				
Pan([x,y[,*]])	Set center point of zoomed display to x,y coordinates based on percentage of normal content full screen display. See note 5. X and Y are integers, 100 times the percentage. By default, x and y are zero (center point).	Both	Adv	-5000 to +5000	
VideoBlendin g ([a,c[,*]])	Controls whether the video is played in its own window/full screen (a=0) or if the video is in the background and HTML content is blended on top of it (where a is the alpha blending value from 1 to 255; c is HTML the HTML background	Both	Adv	a: 0 - 255 c: 32-bit ARGB	

00200000000000000000000000000000

	color that is clear). By default, a=255 (HTML on top) and c=white (white HTML background is clear for video to show through). See note 6.				
Bitmap Layer Extensions					
CreateLayer(b,c,r,d,p)	Create an overlay layer b is the bitmap overlay ref number (or handle) Initialize to color c r is the resolution d is the number of bits per pixel. p is the palette when b=1,2,4 or 8 See note 7.	Both	Y	Adv	b: 1 - 9 c: 32-bit ARGB r: 1 - 4 d: 1, 2, 4, 8, 15, 16, 24, 32 p: palettetbl
ChangePalette(b,p[,*])	Change the palette for layer b	Both	Y	Adv	b: 1 - 9 p: palettetbl
DestroyLayer(b)	Destroy an overlay layer. If b= 0	Both	Y	Adv	1 - 9

	then destroy all layers.				
ShowLayer(b[,*])	Make a layer visible	Both	Y	Adv	1 - 9
HideLayer(b[,*])	Hide a layer	Both	Y	Adv	1 - 9
SetVectorDrawColor(b,c,w[,*])	Set default drawing color (c) and width (w) for layer b. c: ARGB or index into palette w: 1 to 16 pixels	Both	Y	Adv	b: 1 - 9 c: 32-bit ARGB or palette index w: 1 - 16
SetVectorCoordinates(x1,y1,x2,y2)	Set the user coordinate system to: x1,y1 (upper left corner); x2,y2 (lower right corner). The default is 0,0..720,480 for NTSC and 0,0..720 576 for PAL; which matches one to one to pixels in the layer. (All values are 16-bit signed integers) This coordinate system is used for VectorMove and				x: 0 - 720 (or 1920) y: 0 - 480, 576 (or 1080)

T020Z0.62488860

	VectorDraw				
VectorMove(x, y, b[, *])	Move to x,y on layer b. (x,y based on SetVectorCorners)	Both	Y	Adv	x: 0 - 720 (or 1920) y: 0 - 480, 576 (or 1080) b: 1 - 9
VectorDraw(x, y, b[, *])	Draw to x,y on layer b. (x,y based on SetVectorCorners)	Both	Y	Adv	x: 0 - 720 (or 1920) y: 0 - 480, 576 (or 1080) b: 1 - 9
DisplayImage(f, b, a[, *])	Display image from file (types: JPEG, Gif) in layer b, with alpha blend level a. (Layer must have sufficient bit depth.)	Both	Y	Adv	f: filename b: 1 - 9 a: 0 - 255
Time and FX					
SetRelTime([t])	Set the relative time counter to t. (unsigned 32-bit integer in ms) See GetRelTime	Both	Y	Base	t: 0 - 2^{31} unsigned 32-

	property. The relative time affects only commands issued for delayed execution (queued). Once queued commands use machine absolute time. By default, t = 0.				bit integer
FlushCmdQueue()	Flush and/or initialize the command queue.	Both	Y	Base	
Misc Extensions					
SetMixVolume(x[,*])	Set primary audio stream volume level to percentage x to allow overmixing.	Both	Y	Adv	x: 0 - 100 0 = mute main audio
FullScreen(w[,*])	Toggles video playback between full screen and window.	Both		Base	0 = full 1 = window
NetConnect([u[,*]])	Establish WWW connection to optional URL provided. By default, connection is made	Both	Y	Adv	u = text string

02070762485801

T0200-624186860

	with no URL.				
Computer Only:	The following commands should be ignored in set-top players				-
Close()	Close the driver and stop playback of the current DVD.	Both	Y	Base	-
ShowControls (x,y[,*])	Show or hide the video controls in full screen mode, at x,y. Use -1,-1 to hide.	Both	Y	Base	x: 0 - 1920 y: 0 - 1200
ShowContextMenu()	Controls the right mouse click context menu.	Both		Base	-
PopUpMenu()	Displays and allows the audio languages, sub-pictures, and angles to be set to those currently available.	Both		Base	-
SuppressErrors(b)	Suppresses display of error messages (0= suppress display of error messages, 1= display error messages)	Both	Y	Base	0 = suppress 1 = show

ITX Command Summary

Command Notes:

[*] optional parameters

5 Special effects and timed operations are performed with four optional parameters. See section 2.1.2.2.3 for complete details.

1. Open.

10 Opening of VOB files and MPEG files is required for baseline support. Other file types are advanced features. An open file can be played, paused, stopped. Fast forward and rewind are not available. Stopping causes the file pointer to be reset to the start of the file.

15 2. Slow and Slow Reverse.

If slow is supported a speed of $\frac{1}{2}$ is required. Other slow speeds may also be supported; decreasing powers of two are recommended: $\frac{1}{4}$, $1/8$, $1/16$, etc although any value from $\frac{1}{2}$ to $1/99$ is allowed. Integer reciprocal values are used for the speeds, such as 2 for $\frac{1}{2}$ and 4 for $\frac{1}{4}$, etc.

20 3. Menu.

Menu choices are:

25 1: Title Menu
2: Root Menu
3: Chapter Menu
4: Audio Languages Menu
5: Subpicture Languages Menu

30 4. Bookmarks.

The bookmarks are assigned a number when set. A GotoBookMark returns to the same position on the disc as when the bookmark was set (saved). Preservation of bookmarks during powerdown is not required, however, if implemented, bookmarks shall be unique to the disc

1020/07/94 20:08:58 60

(using a generated disc id). A minimum of one bookmark per disc is required if implemented (32 recommended). It is recommended that bookmarks save the entire DVD-Video or DVD-Audio state, but this is not required. At a minimum, the correct title and time must be saved.

5 5. Zoom and Pan.

Zoom parameters are based on a percentage, so integer values of 10000 and 10000 (x and y) indicate 100% of normal full screen display with no zoom. Normally the x and y scale factors should be the same to maintain a correct aspect ratio. When zooming to a value greater than 100%, by default, the center point of the image remains on the center of the display. Panning allows moving the center point of the portion of the image to be displayed. These x and y pan parameters are provided as a percentage of the display from -50% to +50% using integer values from -5000 to +5000. (This is done so that the differences between NTSC and PAL do not have to be calculated in pixels. Additionally, it may also be possible to use the same HTML code for handling 4:3 and 16:9 as well.) If the pan parameters would cause the display to pan off the edge of the video, then the platform software shall only set that panning parameter to the largest or smallest value that keeps the video in the display area.

10 6. Blending.

15 This advanced feature allows an HTML page to be constructed that includes a background color (the colorkey) that is treated as clear. Other information 20 on the page (graphics or text) is then alpha blended 25 with the video. An alpha value of 0 indicates that the video shows everywhere. An alpha value of 255 indicates 30 that the HTML page shows everywhere (except where it is clear as defined by the colorkey value). This allows,

0520700-67485860

for example, placing textual titles on top of the video (or blended with the video). Graphical menus can be added in the same manner. A minimum of 16 (256 recommended) discreet alpha values are required if this 5 feature is supported. However, the alpha blend parameter is always from 0 to 255.

7. Bitmap Layers.

10 The bitmap layer features allow defining and using multiple layers (possibly only one active at a time depending on the playback device) with other layers stored in memory and ready to be activated when needed. This is how an event moderator can remotely draw onto 15 the video image. The number of bits per pixel (color depth) can be 1, 2, 4, 8, 15, 16, 24 or 32. For bpp of 1, 2, 4 and 8 a palette must be provided (32-bit ARGB data). It is anticipated that the most frequently used 20 capability will be bpp values of 1 or 2 to be used for image markup, like a chalkboard with 1 to 4 colors. Bpp values of 15, 16, 24 and 32 allow images to be used on a layer.

Errors and Warnings

25 All commands shall return one of the following error codes

number	name	description	commands
0	OK	Successful	all
1	General Error	Other or Unknown error condition	all
1	FileNotFound	File not found	Open, DisplayImage
2	NotSupp	File type or feature not	

002070-674389801

	orted	supported	
3	NoDisc	Attempt to play with no disc	Play, + others?
4	BadParam	Parameter out of range	many
5	ParamError	Parameter out of range for current disc or current condition	many
6	NoMem	Not enough memory for operation	CreateLayer, DisplayImage
7	QueueFull	Command queue is full	Time delayed command
8	QueueFail	Timed command error (such as overlapping command)	Time delayed command
9	QueueWarn	Timed command accepted, but action may be emulated	Time delayed command

Error and Warning Summary

Layers and pixel formats:

With reference to Fig. 4, a data layout **400** for a layer with 2 bpp, resolution is depicted. Also depicted is a data layout **402** for a layer with a 4bpp resolution. The pixel formats for data in a layer may be stored (internally) in any format. The diagrams on the next page illustrate how it might work in one implementation. The data in the LUT (lookup table) is provided as a color palette by CreateLayer() or ChangePalette(). Each entry in the palette is a 32-bit integer as follows:

byte 0: blue (least significant byte)
 15 byte 1: green

byte 2: red
byte 3: alpha

An alpha value of 0 indicates a transparent color
5 (i.e. the video shows through) and 255 is a solid opaque color
(i.e. no video shows through). The first entry in every color
palette should consist of 4 bytes of zero, a clear color. The
default color value, c, in CreateLayer() should normally be
zero to initialize the layer to a clear color. Special visual
10 effects can be created by use of other values, such as
initializing a layer to red, then erasing it off with a series
of drawing commands and/or by changing alpha values, in the
color palette, etc. Layers and data on them are not affected
by video transitions and special effects having to do with
15 video playback.

As described in the next section, some commands may be modified with time parameters and special effects or transitions. Of particular note to the bitmap layer commands are the ChangePalette() and VectorDraw() commands. A VectorDraw() command with a time duration simply draws a line incrementally. However, the ChangePalette() command with a time duration should be implemented such that there are three complete palettes, the original, the final and the current palette. At each time increment every palette table entry is interpolated towards its final value. The ShowLayer() and HideLayer() commands may have a timed special effect applied to them such as a wipe or fade.

30 Transitions, Special Effects and Timing:

Similar to how an author might use transitions and special effects during video editing, ITX allows a subset of these types of capabilities, depending on the unique

capabilities of each playback system. If a system cannot produce the effect due to hardware or software limitations then it should gracefully degrade to some emulation or simply produce no effect at all, but concluding at the same logical 5 end point.

Transitions can be used, for example, when switching from one scene to another with a time search or chapter search. If no effect is specified, then the playback system 10 would normally produce a standard cut or possibly insert black frames between the scenes. However, if a wipe left is specified, then the final still frame of scene 1 is shown and scene 2 wipes in from the left at the specified rate. (No attempt is made to provide a moving image for both scenes 15 simultaneously.)

The following table details the optional parameters and their ranges:

	Description	range
xxx(?:[t1,t2,fx,p]) see command list in 2.1.2.2 where [*] is replaced by [t1,t2,fx,p]	Command xxx with optional parameters as follows: t1: time 1 (0 or relative start time) t2: time 2 (duration (if t1=0) or relative end time) fx: special effect number p: extra parameter based on fx There are two basic modes: 1. If t1=0, then t2 is the command duration. 2. If t1>0, then t1=starting	t1: 0 - 2 ³¹ t2: 0 - 2 ³¹ fx: 0 - 999 p: 32-bit value based on x all unsigned

102000-67436860

	<p>relative time and t2=ending relative time. t1 and t2 are unsigned 32-bit integers in milliseconds.</p> <p>The possible choices for the variable numbers of parameters are:</p> <p>t1 (not allowed) t1, t2 t1, t2, fx t1, t2, fx, p</p>	32-bit integers
--	---	-----------------

Optional Parameter format for timed commands and special effects

Notes:

5

1. Immediate Execution

To cause a timed command or special effect to start immediately, the t1 parameter must be set to zero (or to a value less than the current relative time). The t2 parameter contains the duration of the command (when t1 = 0). If t1 is greater than zero, but less than the current relative time then the duration is equal to t2-t1. A negative duration is treated as the shortest possible time for that operation.

10

2. Delayed Execution

To cause a command to be queued for later execution, the t1 parameter must be set to a non-zero value greater than the current relative time. To accomplish this the current relative time can be queried via the

15

GetRelTime property. Alternatively, the relative time can be set using the SetRelTime command. Once a command has been queued, the player shall convert the relative time to an absolute time for its scheduled execution and cannot be changed. (However, the command queue can be flushed.)

5 3. SpecialFX.

10 Any immediate or delayed execution command can have a special effect or transition (with optional parameter) added to modify its operation. All special effects and transitions must be accepted by all players but may be emulated or ignored if the effect cannot be performed. The same is true of the timed nature of various commands - if a player has a fixed duration for executing a particular command, then the requested duration is ignored.

15 4. Command Macros

20 Macros of commands can be created by using the SetRelTime and then issuing various commands based with offsets from that time.

25 5. Command queue

The player must support a command queue with a depth of at least two items (eight is recommended; PC/Mac: 64 is recommended). That is, two items are pending execution at a later time while further commands continue to execute. If a command is accepted for the queue, then it must be executed (unless flushed or some other operation negates or overrides its action). Times stored in the queue should be in an absolute machine time (not relative time and not DVD playback time) so that subsequent changes to the relative time do not affect commands already queued.

30 6. Conflicting commands

Because it is possible to schedule commands that have

102020:07/18/08 09:50

overlapping times, these must be checked prior to acceptance for the queue. Non-conflicting, overlapping operation can be accepted. Conflicting overlapping operations may be accepted also if the operations can still be logically completed. Conflicting overlapping operations that are accepted shall return a warning code. An example of a conflicting operation would be to schedule a chapter advance with a 5 second fade in and a second chapter advance after only 2 seconds. Robust internally interlocks must be used if there is any chance of an erroneous program to lock up a machine due to the use of timed or delayed execution commands. A fallback to basic sequential operation is suggested.

5

10

15

Exemplary transitions and special effects according to an embodiment of the invention include the following.

nu m	name	description	parameters
0	none	standard cut, no effect	none
1	dissol ve	old scene dissolves away, new scene appears	none
2	fade	old fades to color, new scene fades in	color: 32-bit ARGB
3	wipe	old scene is wiped off revealing new scene	LRTB
4	reveal	old scene is pulled off, revealing new scene	LRTB
5	slide	new scene slides on, covering old scene	LRTB
6	push	new scene pushes old scene	LRTB

00202000-000000000000

10202020 6/4/868660

		off	
7	peal	old scene is peeled off (like a wipe, but 3D)	LFTB
8	corner wipe	wipe from a corner	ULURLLR
9	corner reveal	reveal from a corner	ULURLLR
10	corner slide	slide from a corner	ULURLLR
11	corner peal	peel from a corner	ULURLLR
12	random boxes	random boxes poke holes in old scene revealing new scene	box size in pixels
13	blinds	horiz or vert blinds wipe off revealing new scene	blind size in pixels
14 - 99		reserved for other transitions	
10 0	none	standard video and audio	none

10		reserved	

4 - 99 9			
10 00 an d up		assignable for specific system effects	

List of Transitions and Special Effects

Notes:

LRTB: 1 = left, 2 = right, 3 = top, 4 = bottom

ULURLLR: 1 = upper left, 2 = upper right, 3 = lower

5 left, 4 = lower right

All transitions and/or effects do not make sense with each command. The guiding philosophy should be to implement only those that make sense. The following table is the recommended set features for the most advanced playback systems with Y_1 being the most basic to Y_4 the most advanced.

ITX Command	time delayed (queued)	time duration	effect/tr ansition
ChangePalette (b, p[, *])	Y_1	Y_4	
ChapterPlay(t , c[, *])	Y_1	Y_2	Y_2
DisplayImage(f, b, a[, *])	Y_1	Y_3	Y_3

Recommended Commands and Special Effects Matchups

ITX Events

Events are integral to synchronizing DVD-Video with other media. With these events, web pages can be synchronized with the audio or video. For example, each ChapterEvent (start of new chapter) can change an HTML storyboard that corresponds to the movie. Time events can be used to coordinate advertising messages in HTML while the video is playing: when James Bond is driving his BMW, an appropriate web page (BMW or auto sales site) can automatically be displayed at the same time.

The value of events is that these external media do NOT have to be embedded or even be known at the time the DVD-Video is authored. This flexibility keeps DVD-Video authoring on schedule and greatly minimizes the authoring costs while adding valuable and unique features to each disc.

Events can be used by the calling application (HTML, C++, or other) to receive notification of DVD playback status. If a platform does not support an event, then an error code must be returned when its use is attempted. Supported events are:

ITX Events	Description	CD - DA	Suppo rt Level	Range
TitleEvent(t)	Called when title changes. Returns the new title number in t.		Base	1 - 99
ChapterEvent(c)	Called when chapter changes. Returns the new chapter number in c.		Base	1 - 99

TODAY'S FEATURES

TitleGroupEvent(g)	Called when title group changes. Returns the new title group number in g.	Base	1 - tbd
TrackEvent(t)	Called when the track changes. Returns the new track number in t.	Y	Base
TimeEvent(e,t)	Called on time change. Returns elapsed time in e and total time in t. Both in milliseconds.	Base	e: 1 - 2 ³¹ t: 1 - 2 ³¹ (~2 ²⁴ is practical limit)
DisplayChange(x)	Called when slide/display list changes. Returns slide number in x.	Base	tbd
AngleEvent(x)	Called on angle change. Returns new angle number in x.	Base	1 - 9
StateEvent(x)	Called when play state changes (i.e., play to pause). Returns state in x. See CurrentState property for values.	Base	0 - 6
SpeedEvent(x)	Called when speed changes (i.e., play to scanning). Returns new speed in x.	Base	1 - 32

TO2070 "6/2426860

UOPSEvent(n)	Called when any UOP changes. Returns UOPs array in n.	Base	32 16-bit values
DomainEvent(x)	Called when domain changes. Returns domain in x.	Base	
MenuEvent(x)	Called when menu ID changes. Returns the ID of the new menu in x.	Adv	
MenuButtonEvent(x)	Called when user clicks a button on a menu. Returns the ID of the button selected in x.	Adv	1 - 32
MouseEvent(b,x,y)	Called when the user clicks either the left or right mouse button. Returns mouse button in b, x coordinate in x, and y coordinate in y.	Adv	b: tbd x: 0 - 720 y: 0 - 480 or 576
AudioEvent(x)	Called when user changes audio track. Returns audio number in x.	Y	Base 1 - tbd
SubpictureEvent(x)	Called when user changes subpicture track. Returns subpicture number in x.	Base	1 - 32

T020401-52486860

AngleEvent(c, m)	Called when user changes video angle. Returns current angle number in c and total number of angles in m	Base	c: 1 - 9 m: 1 - 9
MenuLanguageEvent(x)	Called when user changes menu language. Returns menu language number in x.	Base	1 - tbd
TextLanguageEvent(x)	Called when user changes text language. Returns text language number in x.	Base	1 - tbd
VideoErrorEvent(n)	Called when an error occurs. Returns error number in n.	Base	tbd
ParentalEvent(p, c)	Called when parental control changes. Returns level in p and country in c.	Adv	p: 1 - 8 c: tbd
KaraokeEvent(b)	Called when karaoke event changes. Returns 1 if karaoke track has begun playing, 0 if just finished.	Adv	0 - 1
EjectEvent()	Called when disc is ejected from device. No return value.	Y	Base
InsertEvent()	Called when disc is inserted into device. No return value.	Y	Base

ITX Events Summary

ITX Properties

Properties can be used to find information about commonly used variables; such as time, title and chapter. All properties must be supported even if the advanced feature itself is not supported. Non-supported features may return a reasonable default value (for example if the zoom feature is not supported the zoom properties should always return 10000.) If a feature is not supportable and there is no reasonable value, then a -1 should be returned.

The following properties are supported:

ITX Property	Description	CD DA	Support Level	Range
CurrentElapsed Time	Elapsed time of current title (in milliseconds)	Y	Base	0 - 2 ³¹
CurrentTotalTime	Total time of current title (in milliseconds)		Base	0 - 2 ³¹
CurrentTitle	Currently playing title		Base	0 - 99
CurrentTitleGroup	Currently playing title group		Base	0 - 99
CurrentChapter	Currently playing chapter		Base	0 - 99
CurrentTrack	Currently playing track	Y	Base	0 - 99
CurrentDisplay	Currently playing display list item		Base	0 - 99
CurrentState	Current play state	Y	Base	0 - 6

032098479-070201

0902070-67486880

	(0=None, 1=Scanning, 2=Stop, 3=Pause, 4=Play, 5=Slow Play, 6=Menu)			
CurrentDomain	Current domain	Base	32	
CurrentAudio	Current audio track	Y	Base	0 - 99
CurrentSubpicture	Current sub picture track		Base	0 - 31
CurrentAngle	Current video angle		Base	1 - 9
CurrentMenuLang	Current menu language		Base	1 - 8
NumAudio	Number of audio languages/tracks currently available		Base	1 - 8
NumSubpicture	Number of subpictures currently available		Base	0 - 31
NumAngles	Number of angles currently available		Base	1 - 9
NumMenuLang	Number of menu languages available		Base	1 - 8
GetAudioLanguage(x)	Returns audio language (and extensions) for specified audio number x. Returned audio language is the 2-digit locale.		Base	0 - 99
GetSubpictureLanguage(x)	Returns subpicture language (and extensions) for specified subpicture number x. Returned subpicture language is		Base	0 - 99

098447-07020704

	the 2-digit locale.			
GetMenuLanguage(x)	Returns menu for specified menu number x. Returned menu language is the 2-digit locale.	Base	0 - 99	
SupportedFeatures	Returns feature bits corresponding to capabilities of current system (Must be available before the navigator is in the play state). See section 4.1 and 4.2 for details.	Y	Base	32-bit mask
Version	Returns version of platform. This field can also be used to determine parsing of certain components in the SupportedFeatures property. Returns major version and minor version unique to each playback system.	Y	Base	Two 16-bit integers
CurrentZoomX	Current Zoom X value	Base	Unsigned 16-bit	
CurrentZoomY	Current Zoom Y value	Base	Unsigned 16-	

102070-624186360

			bit	
CurrentPanX	Current Pan X value	Base	Unsign ed 16-bit	
CurrentPanY	Current Pan Y value	Base	Unsign ed 16-bit	
CurrentMenuID	Current ID associated with currently selected menu	Base	0 - 99

ITX Properties Summary

Notes:

8. Layer Properties.

The MaxLayers property is how many simultaneous overlay layers the hardware can process or the software/hardware system can effectively emulate as simultaneous overlays in real time and blend with a full screen video. The NumLayers property returns the number of layers that can be created (but not necessarily used simultaneously) based on the amount of free memory currently available.

The concept of layer resolution is that a 720 x 480 image requires some number of bytes of data (depending on the bpp) at a resolution of 1. A resolution of 2 uses one data item for a 2 x 2 pixel area of the image (i.e. 4x less data). This allows a layer to be defined for markup that doesn't need high accuracy and/or a method for a platform to perform graceful degradation if not enough memory is available for a full resolution layer. Resolution 3 is a 3 x 3 pixel area, and is somewhat awkward. Resolution 4 is a 4 x 4 pixel area. No other resolutions are defined.

25 Disc Type Detection

The GetDiscType property requires that the type of disc in the player be available to the application. A disc may be only one of the following types:

30

- 0: drive empty or unknown state
- 1: DVD
- 2: CD
- 3: other

For a DVD disc, any number of the DVD sub-types may be detected and have their respective bits set as follows:

5

Bit number	Description	Detection method
0	DVD-Video	VIDEO_TS\VIDEO_TS.IFO file present
1	DVD-Audio	AUDIO_TS\AUDIO_TS.IFO file present
2	DVD-ROM material present	Any file in the main directory other than VIDEO_TS and AUDIO_TS directories
3	PCFriendly	DISC.ID file present
4	ITX	ITX.HTM file present
5-7	reserved	N/A

Disc Sub-Types bit fields

098979.070201

10 Browser Requirements

Web browsers and the software environment on each platform shall be capable of the following

Feature	Support Level
ITX features in para 2.1.2.2 - 2.1.2.4	Base/Adv

T020/00-5/426860

Presentation layer must properly interpret HTML with embedded video	Base

Java support	Adv
Streaming media support	Adv
Macromedia Flash	Base/Adv
Macromedia Shockwave	Adv
QuickTime	Adv
Interfaces to common hardware features (ID, cookie, etc.)	Base

Browser Requirements Summary

HTTP Header Formatting (Base)

Each HTTP header should be formatted with the following information (in addition to standard HTTP header information):

- Language
- Screen resolution
- Hardware platform identifier and version
- Browser identifier and version

10

Cookies (Base)

Browser must be able to support cookie mechanism, which of course places a memory requirement on the hardware device. Cookie shall be placed by browser in local persistent memory and shall be readable only by a specific server and browser/hardware partner. Cookie shall contain:

- 5 • User/hardware ID: generated by computer software or by hardware platform (in case of set-top)
- 10 • Disc ID: generated by local hardware based on a hashing algorithm.
- BCA number: read from lead-in area of DVD

15 The following is matter of design choice.

- 15 • Format of cookie
- When to place cookie (i.e., insertion event)

Direct Connection to Navigator (Adv)

Ability to pass commands directly to DVD/CD navigator, such 20 as:

- All DVD/CD navigation commands
- Additionally, must have ability to set GPRMs

Platform/Hardware Requirements

25

In order to provide a consistent baseline platform for ITX content developers it is important that the platform and hardware vendors properly support the ITX API. Not all hardware platforms will have identical capabilities. So it is 30 important that each platform provide access to the features that are available and graceful degradation for those that are not supported - and provide this as feedback so that content developers understand how their content will function on

different platforms.

Baseline Hardware Platform Requirements

5 Hardware platform vendors must provide hardware and
interfaces capable of performing all the functions specified
as base above to be ITX compatible. If the feature is not
available it is important that it either be emulated or
degrade gracefully in some manner. Items marked as advanced
10 can be supported or not, but the Supported Features bits must
accurately indicate what features are available.

15 It is expected that hardware platforms meet these
minimum specifications:

20

- Support HTML 3.2 browser and other requirements in
paragraphs 3.x
- Play video full screen down to a 4:1 downscale (180 x 120
(NTSC), 180 x 144 (PAL)).

bit	ITX Baseline Command Group	Command list
0	GRP_OPENVOB	Open(filename ! type)

29	GRP_WEB	NetConnect([u[,*]])
30-31	N/A	reserved (must return 0)

Advanced Capabilities Grouping

Local Storage/Memory Requirements:

5 The only local storage requirement of ITX is minimal memory for the purpose of placing cookies. Optionally, the hardware platform can also support larger local memory for the purposes of caching web pages. More information: TBD.

10 Hardware Platform Considerations

- Some set-top players may not be able to access both DVD-Video and ROM content at the same time. The application will need to permit intelligent caching, and the platform

will need to provide sufficient memory.

Enumerations

With reference to Fig. 5, a process 500 is described for providing an enhanced multimedia experience. In an 5 operation 502, DVD content is recorded onto a DVD disc. Then, in an operation, 504, the HTML content is recorded onto the same disc. Thereafter, in an operation 506, the disc is inserted into a client device. The client device can be, for example a personal computer having DVD capabilities and an 10 Internet browser. The client device could also be a set top box. Then in an operation 508, the DVD content is accessed by DVD software present on the client device. In a step 510, the HTML data is accessed. The HTML content is preferably accessed by the browser software already present on the client 15 device. The HTML content is can include data obtained via the Internet by the browser software under the direction of the HTML content recorded onto the disc. Also, the HTML content can consist of only the recorded HTML data with no need for Internet connection. Finally, in an operation 512, the DVD 20 content is supplemented with the HTML content to provide an enhanced multimedia event. The HTML content can be added to the DVD content in multiple ways. For example, the HTML content can be in the form of a picture within a picture, (e.g. a relatively small window within a DVD video). The HTML 25 content could also be update data incorporated directly into a video or could be in the form of navigation commands or relevant Internet links.

With reference to Fig. 6, a general process 600 is 30 described for enhancing DVD-content with ROM content. In an

102070-627486360

operation 602, DVD content is recorded onto a disc. The DVD content is in the form of standard DVD content familiar to those skilled in the art. Then, in an operation 604 DVD-ROM content is generated. This content is preferably HTML encoded content which can be read and operated on by standard Internet browsers. In an operation 606, a plurality of directories are incorporated into the DVD-ROM content. The directories allow operation with multiple user device platforms. The directories preferably include common directories which can be used on several platforms sharing common properties as well as platform specific directories for use with platforms having unique interface requirements. Thereafter, in an operation 608, the DVD-ROM content along with the directories is recorded onto the disc. Then, in an operation 610, the user's particular device platform is determined. This operation occurs automatically upon the user's attempt to use the disc.

Then, in an operation, 612, a directory appropriate for use with the determined user device platform is selected from among the plurality of directories. This selected directory is called using Javascript function and appropriate tags associated with the directories.

While the invention herein disclosed has been described by means of specific embodiments and applications thereof, numerous modifications and variations could be made thereto by those skilled in the art without departing from the scope of the invention set forth in the claims.
